Why we use the database?

- The purpose of the database;
 - helping people and organizations keep track of things.

Why we use the database?

- Lists are used to keep track of things without using a database.
 - Shopping list,
 - to-do list,
 - List of paid invoices

Why we use the database?

<u>Customer Name</u>	<u>Job</u>	<u>Company</u>	<u>Address</u>	<u>Price</u>
Ahmet	mimar	A	Çanakkale Cad. 43/5	1000 TL
Sema	öğretmen	B	Kayabaşı <u>mah.</u> A Blok 8/4	250 TL
Serdar	mühendis	C	Gazi <u>Mah</u> 6/7	350 TL
Zerrin	emekli	B	Kayabaşı <u>mah.</u> A Blok 8/4	700 TL
Mehmet	Öğretim elemanı	B	Kayabaşı mah. A Blok 8/4	1200 TL
Defne	Doktor	D	Gazi Mah 6/7	100 TL
Elif	avukat	A	Çanakkale Cad. 43/5	150 TL

Why we use the database?

- Problems with lists;
 - For example, the address of company B has changed.
 - Address information in 3 lines should also change
 - If it is missing, information inconsistency occurs.
 - It can cause both a **waste of time** and an **error**.

Why we use the database?

- Problems with lists;
 - For example, company A no longer works with your company,
 - If you delete the record related to company A from the list, you will lose information such as customer information and company address where the product was sold.

Why we use the database?

- Problems with shared data;
- For example, different departments of your company need to display company information;
 - Communication department: company, address
 - Marketing department: company, price
 - Customer service: customer name, job, company

Why we use the database?

- Problems with shared data;
 - Sharing all of this information with all departments is inconvenient for different reasons.
 - Security
 - customer privacy
 - etc.

Why we use the database?

- The biggest drawback for lists is that it combines different types of information into a table.

Why we use the database?

- For DMS, the process of placing different types of information in different tables is called **normalisation**.
- For the previous list;
 - customers
 - Worked companies
 - sales information

Why we use the database?

- Customers

<u>Customer Name</u>	<u>Job</u>
Ahmet	mimar
Sema	öğretmen
Serdar	mühendis
Zerrin	emekli
Mehmet	Öğretim elemanı
Defne	Doktor
Elif	avukat

Why we use the database?

- Worked Companies

<u>Company</u>	<u>Address</u>
A	Çanakkale Cad. 43/5
B	Kayabaşı <u>mah.</u> A Blok 8/4
C	Gazi <u>Mah</u> 6/7
D	Gazi <u>Mah</u> 6/7

Why we use the database?

- Sales Information

Customer Name	Price
Ahmet	1000 TL
Sema	250 TL
Serdar	350 TL
Zerrin	700 TL
Mehmet	1200 TL
Defne	100 TL
Elif	150 TL

Why we use the database?

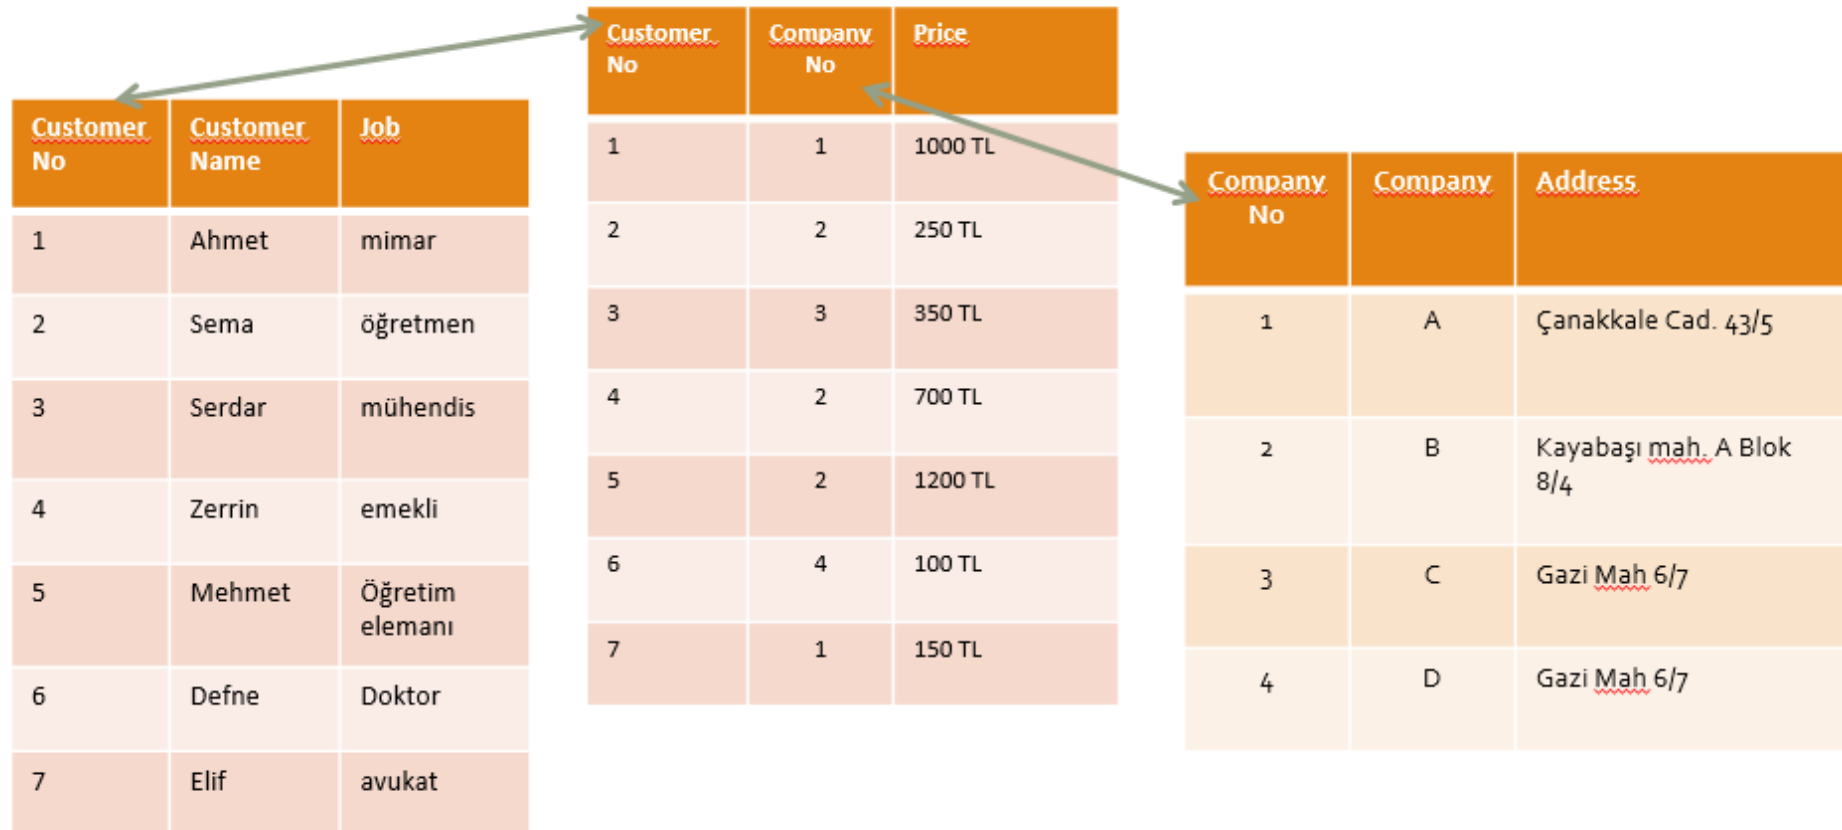

- When different types of information are placed in different tables, most of the problems related to the following works are eliminated;
 - changing information
 - deleted information
 - with shared information.

Why we use the database?

- When different types of data are in different tables;
 - Relationships need to be established in order to answer questions such as which customer bought the product from which company ?

Why we use the database?

- Relations

Why we use the database?

- Relations

Why we use the database?

- Joining tables
 - So what is done to get the initial holistic list?
 - SQL language is used.

What is database management system?

- Components of the database system;

What is database management system?

- The user does the following:
 - It uses the database to perform its work,
 - Adds new data
 - Modify existing data,
 - deletes data,
 - Reads data through queries or reports

What is database management system?

- Database Application:
 - It is one or more computer programs that provide communication between the database management system and the user.
 - Creates queries and reports,
 - Receives data from the user or sends the data to the user,

What is database management system?

- Database Management System:
 - It receives requests from the application and performs them by reading or writing data on database files,
 - It reads SQL statements and converts these statements into instructions for the computer's operating system to read or write data on database files.

What is database management system?

- Functions of Database Application
- Functions of Database Management System

What is database management system?

- Database Application:
 - Creates and processes forms,
 - Creates queries and forwards queries,
 - Creates and operates reports,
 - Performs application logic,
 - Controls the application.

What is database management system?

- Database Application:
- Creates and processes forms, for example, in a web-based application;
 - Creates HTML and other web formats to be displayed on the user's computer,
 - When the user fills out the forms and sends the data back, it sends the DBMS requests for the necessary adjustments.
 - If an error occurs in the process, it displays the necessary message to the user and/or performs the necessary actions.

The image shows a web form titled "Partner Enrollment". It includes a section for "ACCOUNT LOGIN INFORMATION" with a text input for "Account Name *". Below this is a "Primary Contact" section with four text inputs: "First Name *", "Last Name *", "Company Name *", and "Title". There are also inputs for "Phone Number *" and "Email *". At the bottom, there is a "SUPPORT CONTACT" section with a text input for "Notification Email".

Partner Enrollment

SUPPORT CONTACT

In the event of planned outages for maintenance or notifications of updates to the system, please specify any email addresses to be notified.

Notification Email

What is database management system?

- Database Application:
- Creates queries and forwards queries,
 - Generates the query to be transmitted to DBMS,
 - These requests are usually expressed in SQL,
 - When the query is executed, the results are formatted and transmitted to the user,

The screenshot shows the 'SQL Generator' web application. At the top, there's a header 'SQL Generator'. Below it, a section 'Please Select a Database' contains a text input for 'Database Name' with the value 'album' and a 'GO' button. A link 'Click here to view data model' is also present. The main interface is divided into three columns: 'Select a Table Option', 'Select a Query Option', and 'Generated Query'. Under 'Select a Table Option', there are radio buttons for 'One Table Only' (selected), 'Two Tables', and 'More Than Two Tables'. Below these is a list box containing 'track' and 'album'. Under 'Select a Query Option', there are checkboxes for 'FUNCTION', 'AGGREGATE OPERATION', and 'COUNTING'. Under 'COUNTING', there are checkboxes for 'COUNTING NUMBER IN COLUMN', 'COUNTING ROWS' (checked), and 'NULL VALUE IGNORANCE'. At the bottom of this column is a dropdown menu showing 'MAXIMUM'. The 'Generated Query' column displays the SQL query 'SELECT COUNT (*) FROM album;'. Below the query are two buttons: 'Generate Query' and 'Execute Query'. At the bottom of the page, there is a table with one row showing the result of the query.

count
7

What is database management system?

- Database Application:
- Creates and operates reports,
 - Data is requested from DBMS through queries and query results are presented in the form of reports,

The screenshot shows the DTM Query Reporter application window. The title bar reads "OurCustomers.qrp - DTM Query Reporter". The menu bar includes "File", "Report", "Tools", and "Help". The toolbar contains icons for file operations and macros. The main window is divided into several panes. The top pane shows the connection information: "Connected to SQL Server: 192.168.137.11/ssa(NorthwindOriginal)". Below this is a tabbed interface with "Query", "Output", "Report", "Header", "Footer", "Markers", "Properties", "Parameters", and "Converters". The "Query" tab is active, displaying an SQL script:

```
select
    CompanyName, City, Phone
from Customers order by City
```

. Below the script is a "File" section. The bottom pane shows a preview of the report titled "The Customers List". It includes a timestamp "Report created at 12-01-2019 12:02:29" and a table with three columns: "CompanyName", "City", and "Phone". The table contains 10 rows of data. At the bottom of the preview, it states "The preview shows up to 50 first report rows. Click it to refresh." and "Preview created for 1 rowsets and 51 rows".

CompanyName	City	Phone
Drachenblut Delikatessen	Aachen	0241-039123
Rattlesnake Canyon Grocery	Albuquerque	(505) 555-5939
Old World Delicatessen	Anchorage	(907) 555-7584
Vaffeljernet	Århus	86 21 32 43
Galería del gastrónomo	Barcelona	(93) 203 4560
LILA-Supermercado	Barquisimeto	(9) 331-6954
Magazzini Alimentari Riuniti	Bergamo	035-640230
Publix Super Markets Inc.	Berlin	030-0074321
Chop-suey Chinese	Bern	0452-076545
Save-a-lot Markets	Boise	(208) 555-8097
Folk och få HB	Bräcke	0695-34 67 21
Königlich Essen	Brandenburg	0555-09876

What is database management system?

- Database Application:
- Performs application logic,
 - For example, the user made a request for 10 units, but 8 units were found in stock,
 - What happens depends on the logic of the program,
 - It is the task of the application program to implement the appropriate logic.

What is database management system?

- Database Application:
 - Controls the application

What is database management system?

- The Database Management System does the following:
 - Creating the database, creating the tables,
 - Reading data from the database and updating the data,
 - Realizing the limitations on data values,
 - It prevents one user's process from interfering with the other user's process.
 - Allowing users to take action within the limits of their authority,
 - Backing up data in the database.

Database

- Database is data stores that consist of following related records.
 - Metadata (metadata)
 - index
 - stored procedure
 - trigger
 - data integrity (referential integrity)

Database

- Data about the structure of the database is called metadata.
 - Table names
 - column names
 - Properties of tables and columns etc.

Database

- Metadata example:

<u>Tabloe no</u>	<u>Table name</u>	<u>Column number</u>	<u>Row number</u>
1	Müşteriler	3	7
2	Firmalar	3	4
3	Satışlar	3	7

<u>Column no</u>	<u>Column name</u>	<u>Data type</u>	<u>Length</u>	<u>Table no</u>
1	<u>id</u>	<u>int</u>	4	1
2	<u>Mus_adi</u>	<u>char</u>	50	1
3	<u>meslegi</u>	<u>char</u>	50	1

Database

- Some databases contain application metadata.
- This metadata defines application components such as forms and reports.
- DBMS has several tools to show the structure of the database.

Database

- At the same time, there are indexes used in databases to improve the performance of the database.
- Indexes are tools that show which records are in which tables.

Database

- Stored procedures are compiled SQL statements.
- Because they are database objects, they are directly included in the database manager program.
- For example, stored procedures can be created for the purpose of taking a backup of data in a table or remove a backup of data that has passed more than a year.

Database

- Stored procedures are codes for doing a specific duty defined in a database.
- These codes are optimized because they are compiled at the same time as they are written, and they are the fastest ready-to-run codes.

Database

- A trigger is a special type of stored procedure that automatically runs when an event occurs in the database server.
- The events that trigger the triggers on the table are insert, update, delete events.

Database

- For example, it is a typical use of triggers to decrease or increase the amount of stock as a result of stock movements.

Database

- Since both **triggers** and **stored procedures** are codes on the database, they run on the database server.
- It is one of the powerful components of the Client & Server architecture.
- There are databases in client & server architecture as follows.
 - Oracle, Sybase, MS SQL, Interbase, FireBird etc.

Database

- Because they work on the server where the data is located, the data does not go back and forth between the client and the server.
- Therefore minimal data is sent from the server to the client side.

Database

- In a relational database
- Let's assume that the department information of the person in the **PERSONNEL** table is kept in the **SECTION_NO** variable and
- the name of the department is in the **SECTION** table.

Database

- If the section numbered as 1 is used by any personnel, the record with SECTION_NO value of 1 from the SECTION table must not be deleted.
- Protecting data integrity by making such controls is called **referential integrity**.

Database

- The use of triggers is highly preferred in order to ensure data integrity.

Database

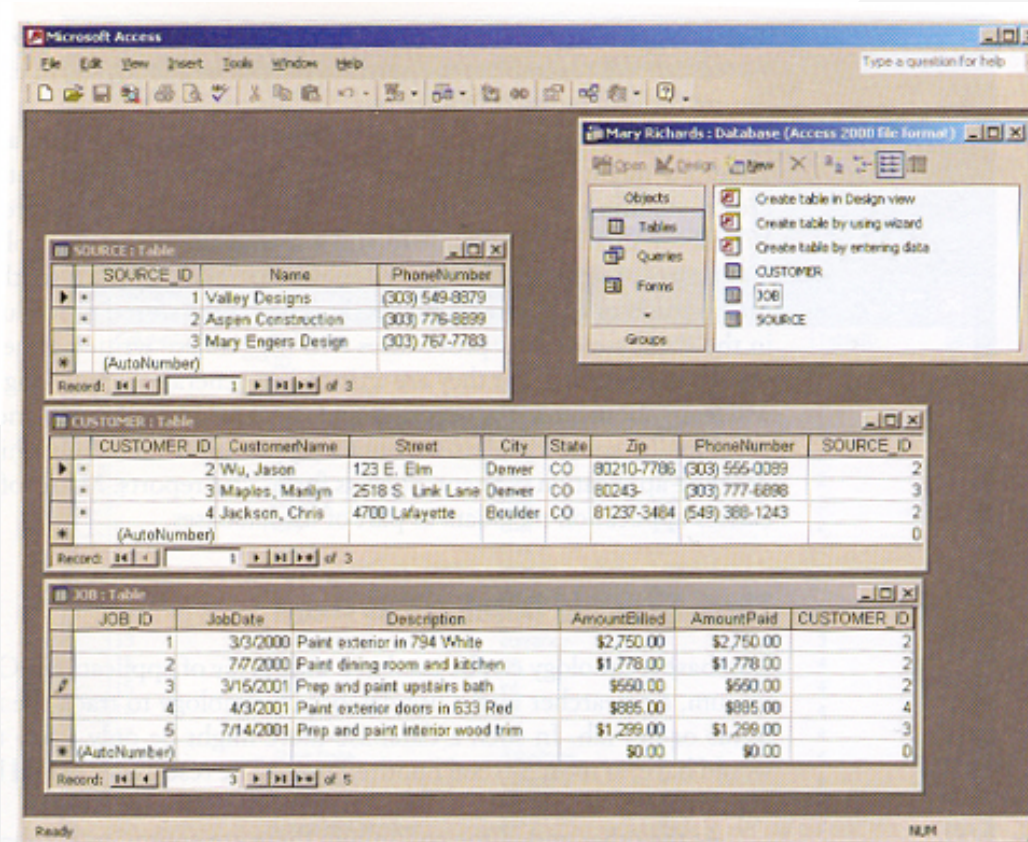

- There can be 3 types of database systems:
 - used by a single person,
 - used by small businesses,
 - Used by large international companies

Database

- used by a single person,
 - Painter
 - Whose house was painted, when and how much?
 - What was painted in the painting, what colors and styles were used?
 - Who referenced others? Who are the referrals?

Database Systems

used by a single person,
